phonological storage

chaining

- Retrieval cue is the previous item
- Problems with repeated items
- No evidence for higher errors following repeated items
- No difference in errors if sequence is mixed (BRGQDY)
- Probability of correct retrieval is independent from previous errors

ordinal

- Retrieval cue is the associated value
- Order is defined relationally; if the order changes (due to noise), items are transposed → people make these kinds of errors too
- Position of an item can be defined only by referring to its neighbors

positional

- Retrieval cue is the positional code
- Position of an item can be defined independent of its neighbors
- No problem with repeated items
- No problem with erroneous responses because items are independent
- Most common errors are transpositions and: erroneous items are clustered around their correct position
- But another error is interposition, transposition between groups → position of items is coded for in groups, independently of surrounding items

2 TYPES *of organization*

1

Serial order

2

Behavioral organization

1 SERIAL ORDER

arbitrary sequences

a ROBOTIC example

SERIAL ORDER *architecture*

Serial order EQUATIONS

$$\begin{aligned} \tau \dot{d}_i(t) = & -d_i(t) + h_d + c_0 f(d_i(t)) \\ & - c_1 \sum_{i' \neq i} f(d_{i'}(t)) + c_2 f(d_{i-1}^m(t)) \\ & - c_3 f(d_i^m(t)) - I_C(t) \end{aligned}$$

$$\begin{aligned} \tau \dot{d}_i^m(t) = & -d_i^m(t) + h_m + c_4 f(d_i^m(t)) \\ & - c_5 \sum_{i' \neq i} f(d_{i'}^m(t)) + c_6 f(d_i(t)) \end{aligned}$$

2 BEHAVIORAL ORGANIZATION

flexibility

3 COGNITIVE MODELS *of sequences*

chaining

ordinal

positional

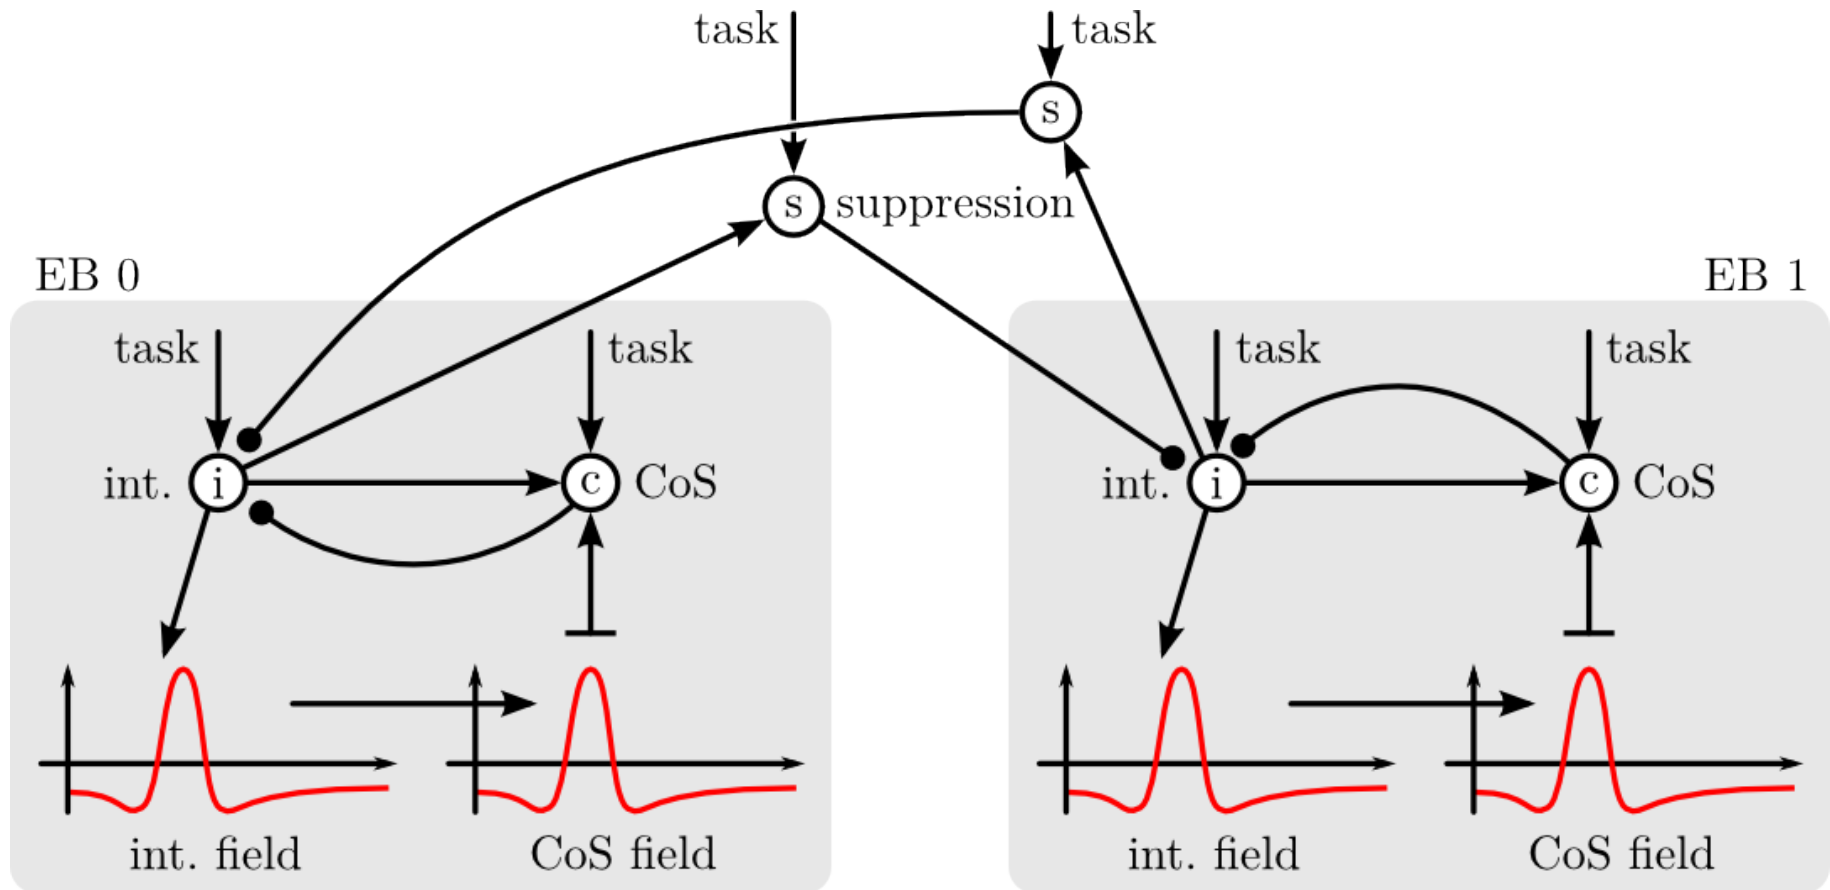

Elementary **BEHAVIOR**

PRECONDITION *constraint*
