The Vehicle's Position

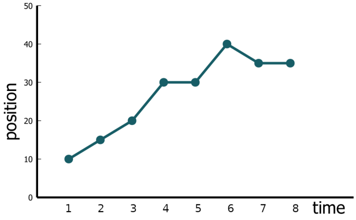
Exercise 1



1. Calculate the change of position between time 3 and 4. Next, calculate the rate of change of the position (= velocity) between time 3 and 4.
2. Do the same for the time between 3 and 5.
3. Now assume that the position is given as $f(t) = t^2$. Plot that function from time 0 to 3. Calculate the velocity between time 0 and 2. Draw a line through the points $(0, f(0))$ and $(2, f(2))$. How does the slope of the line relate to the velocity? Why? Next, do the same for the velocity between time 1 and 2, then between time 1.5 and 2.
4. Think about what it would mean to calculate the velocity *at* time 2.

Formal Definition

Differentiable Function

- The **derivative of** f **at position** x_0, short $f'(x)$, is defined as

$$\lim_{x \to x_0} \frac{f(x) - f(x_0)}{x - x_0}$$

- This denotes the value of $\frac{f(x)-f(x_0)}{x-x_0}$ as x gets closer and closer to x_0.
