**Lecture course “Autonomous robotics: Perception, Action, and Cognition”:
About using ChaptGPT for exercises**

In the initial session on the organization of the course, I pointed out that the goal of exercises and essay was to read and understand scientific text, and to practice writing scientific and technical texts that reflect such understanding. I pointed out that the use of ChatGPT and similar AI tools prevents participants from learning these skills and is therefore not permitted in the course.

Unfortunately, we have detected the use of ChaptGPT in some exercise and essay submissions. This is a form of cheating that will not be tolerated.

1. Participants engaging in this form of cheating will see all their bonus points annulled. No further submissions of such participants will be corrected.
2. We reserve the right to further pursue this form of cheating by involving the examination office of the Faculty of Computer Science.
3. The rules of the course are amended so that bonus points achieved in the exercises are only applied when the mark in the exam reaches at least 80%. This is the level typically exceeded by students who seriously engage in the exercises.
